

Fields

Big Ideas

What is a field?

Gravity, Electrostatics and Magnetism can all be characterized by fields

Manipulation of fields can lead to the development of unique technological devices.

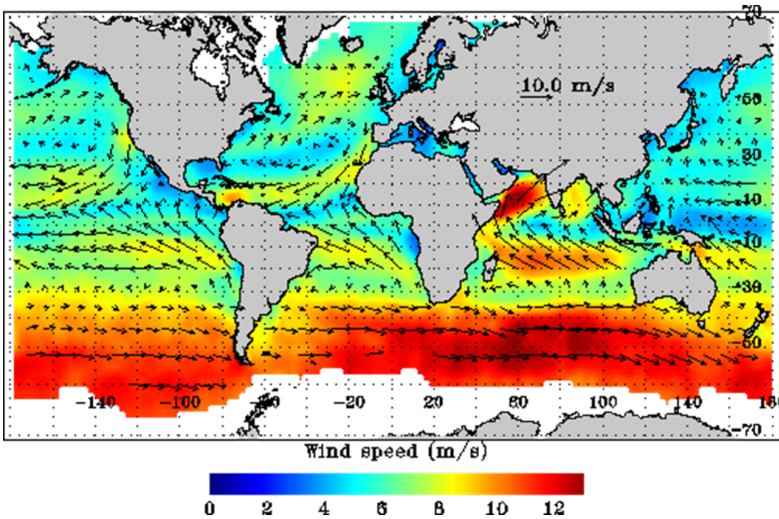

Outline

1. Definition and Examples of Fields
2. Gravitational Fields
3. Electric Forces and Fields
4. Sample Problems

1. What is a Field ?

A field is something that has a well defined value at every point in space. Scalar fields have only a magnitude at every point. Vector fields also have a direction at every point.

Examples of Fields

Wind Velocity - Vector Field

Temperature - Scalar Field

Examples of Fields - cont'd

Magnetic Field - Vector Field

Examples of Fields - cont'd

Gravitational Field - Vector Field

Electric Field - Vector Field

Turbulent Air Flow
- Vector Field

The Gravitational Field

The gravitational field strength is defined as the force of gravity acting on a 1kg object at a point in space.

The units on gravitational field strength are N/kg.

$$\vec{F}_g = \frac{G m_1 m_2}{r^2} \quad \text{let } m_1 = 1 \text{ kg.}$$

$$\vec{g} = \frac{G m}{r^2}$$

units on $\vec{g} \rightarrow \text{N/kg.}$

m - mass creating the field.

G - $\text{N} \cdot \text{m}^2 / \text{kg}^2$

Newton - kgm/s^2

$$\text{N/kg} \leftrightarrow \text{m/s}^2$$

at surface of earth

$$\vec{g} = \frac{G M_e}{r^2} = 9.8 \text{ N/kg.}$$

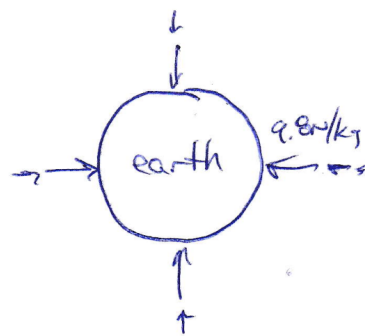

$$= 9.8 \text{ m/s}^2$$

$$\vec{F}_g = m \vec{g}$$

Variables Required:

- Mass of earth, $M_e = 5.97 \times 10^{24} \text{ kg}$
- Radius of Earth, $R_e = 6.38 \times 10^6 \text{ m}$
- $G = 6.67 \times 10^{-11} \text{ N} \cdot \text{m}^2 / \text{kg}^2$

*

2. Electric Forces and Fields

*

Electric Force

1. F_e varies directly with the magnitude of the charge.

$$F_e \propto q$$

$q \rightarrow$ charge
(measured in
Coulombs - C)

2. F_e varies indirectly (inversely) with the square of the distance between the charges.

$$F_e \propto \frac{1}{r^2}$$

$$F_e \propto \frac{q_1 \cdot q_2}{r^2}$$

$$\boxed{F_e = \frac{k q_1 q_2}{r^2}}$$

k - Coulomb's Constant
 $= 9.0 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$

*

Example:

Compare the Electric Forces to the Gravitational Forces between an electron and a proton that are $1.0 \times 10^{-10} \text{ m}$ apart.

$$m_e = 9.11 \times 10^{-31} \text{ kg}$$
$$q_e = -1.602 \times 10^{-19} \text{ C}$$

$$m_p = 1.67 \times 10^{-27} \text{ kg}$$
$$q_p = +1.602 \times 10^{-19} \text{ C}$$

$$F_g = \frac{G m_e m_p}{r^2}$$
$$= 1.0 \times 10^{-47} \text{ N.}$$

$$G = 6.67 \times 10^{-11} \text{ N} \cdot \text{m}^2 / \text{kg}^2$$

$$F_e = \frac{k q_e q_p}{r^2}$$
$$= 2.3 \times 10^{-8} \text{ N}$$

$$k = 9.0 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$$

$\sim 2.3 \times 10^{39}$ x's stronger

*

Electric Fields

The electric field strength is defined as the magnitude of the electric force acting on a 1C charge at a point in space.

The units on electric field are N/C.

By definition the direction the electric field points is the direction a positive charge would move.

$$F_e = \frac{kq_1q_2}{r^2}$$

let $q_1 = 1C$

\vec{E} - electric field strength

$$\vec{E} = \frac{kq}{r^2}$$

$q \rightarrow$ charge creating the field.

units on $\vec{E} = N/C$

$k \rightarrow N \cdot m^2/C^2$

$$\vec{F}_e = q \vec{E}$$

force on a particle in a field.

Uniform Fields

Gravitational

$$g = 9.8 \text{ N/kg } [\downarrow]$$

*
uniform in magnitude
& direction.

Electric

$$\frac{\text{V}}{\text{m}} \leftrightarrow \frac{\text{N}}{\text{C}}$$

$$\vec{E} = \frac{V}{d} \quad \frac{\text{(Volts)}}{\text{(metre)}}$$

$$\downarrow$$

N/C

$$\text{Volt} \rightarrow \text{J/C}$$

Sample Problems

1. Electric field created by two particles
2. Acceleration of a charged particle in a uniform field

Sample problem #1

*

Two charged spheres are 135 mm apart. The charge on q_1 is $-5.6 \times 10^{-7} \text{ C}$ and the charge on q_2 is $11.2 \times 10^{-7} \text{ C}$.

- Find the net electric field at point P.
- What would the force on an electron be if it was placed at point P? (the charge on electron is $-1.602 \times 10^{-19} \text{ C}$)

$$k = 9.0 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$$

$$a. \quad \vec{E}_{\text{TOT}} = \vec{E}_1 + \vec{E}_2$$

$$\vec{E}_1 = \frac{kq_1}{r^2} = 2.5 \times 10^6 \text{ N/C} [\leftarrow]$$

$$\vec{E}_2 = \frac{kq_2}{r^2} = 1.2 \times 10^6 \text{ N/C} [\leftarrow]$$

$$\vec{E}_{\text{TOT}} = 3.7 \times 10^6 \text{ N/C} [\leftarrow]$$

$$b. \quad \vec{F} = q \vec{E}$$

$$= (1.602 \times 10^{-19} \text{ C})(3.7 \times 10^6 \text{ N/C})$$

$$= 6.0 \times 10^{-13} \text{ N} [\rightarrow]$$

	human hands (dry)
	glass
	human hair
	nylon
	cat fur
	silk
	cotton
	steel
	wood
Tend to gain electrons	amber
	ebonite
	plastic wrap
	Teflon®
	(-)

Sample problem #2

*

An electron is placed in the middle of a two charged plates which are separated by 8.5 cm. If the voltage across the plates is 120V what is the acceleration of the electron? (the charge on an electron is $-1.602 \times 10^{-19} \text{C}$ and the mass of an electron is $9.11 \times 10^{-31} \text{kg}$)

$$\vec{E} = \frac{V}{d} = \frac{120\text{V}}{0.085\text{m}} = 1412 \text{ V/m} [\downarrow]$$
$$= 1412 \text{ N/C} [\downarrow]$$

$$\vec{F} = q\vec{E} = (1.602 \times 10^{-19} \text{C})(1412 \text{ N/C})$$
$$= 2.262 \times 10^{-16} \text{ N} [\uparrow]$$

$$\vec{a} = \frac{\vec{F}}{m} = \frac{2.262 \times 10^{-16} \text{ N} [\uparrow]}{9.11 \times 10^{-31} \text{ kg}} = 2.5 \times 10^{14} \text{ m/s}^2$$
$$[\uparrow]$$

Comparison : Gravitational vs. Electric Field Formulas
